The effects of prepregnancy obesity on the placentation of breastmilk. Therefore caution should be exercised when presenting the results.

• Communicating human biomonitoring results to ensure policy coherence with public health recommendations: analysing breastmilk whilst protecting, promoting and supporting breastfeeding. Arendt M Environmental Health 2008, 7(Suppl 1):S6 doi:10.1186/1476-069X-7-S1-S6 http://www.ehjournal.net/content/7/S1/S6. This article was published in the Environmental Health Journal in its latest supplement "Ethics and communications in human biomonitoring: European perspectives". Biomonitoring of breastmilk is used as an indicator of environmental pollution ending up in mankind. Messages about chemicals detected in breastmilk are often dramatized by the media and cause a backlash against breastfeeding. Breastmilk has important nutritional components and live protective factors. Cohort studies in environmental health prove that long-term breastfeeding counterbalances the effect of prenatal exposure to chemicals. Therefore caution should be exercised when presenting the results of biomonitoring of breastmilk.

- Darmangeat, Véronique. *The Frequency and Resolution of Nipple Pain When Latch is Improved in a Private Practice,* Clinical Lactation, Volume 2 Issue 3, septembre 2011. This study examined the frequency and resolution of nipple pain in 61 consecutive cases in a private practice. For 24 of these mothers, the pain ended by improving the latch. The majority of consultations for pain were resolved simply by improving the baby's positioning at the breast. This implies that it is important to address latch issues from the very first days of the baby's life.
